Section 2: Karel Problem Solving

This week in section, your goal is to solve a Karel problem together using decom
refinement.

Here's the Link to the Section 2 Code!

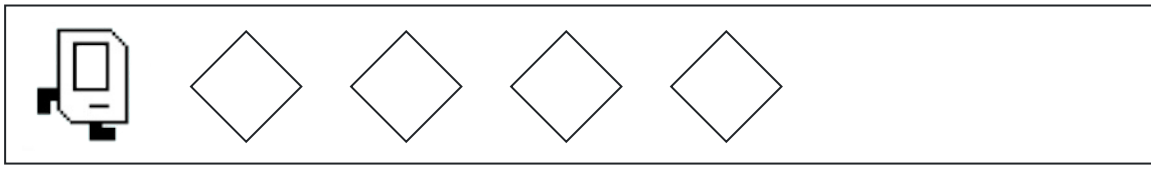
Spread Beepers

In this task, Karel will always start by standing in front of a pile of beepers. Karel
entire pile of beepers and spread them out along the row so that there is exactly
cell, and exactly as many cells with beepers as were in the original pile. The line
should begin where the pile originated (which is on row 1 column 2).

Here is an example before and after:

Before:

After:



You may assume that:

- There is only one row in the world
- Karel starts with infinite beepers in her bag (how will you make sure to only
beepers as were in the original pile?)
- The pile of beepers is on the second corner, directly in front of where Karel s
- The world is wide enough for all the beepers, and there will be empty cells
the end

Write the code to implement Spread Beepers Karel. **Come up with a strategy fi**
high-level steps Karel needs to take?" and make these steps into helper function
program should work for a pile of any size.
