Spread Beepers Karel

Main Goals:

- Strengthen students' confidence with loops and decomposition.
- Deepen their problem-solving skills with a trickier Karel challenge.
- Continue building section camaraderie and curiosity

Key Resources:

1. Student Handout
2. Section Solutions
3. Starter Code
4. Slide Deck (From Head TAs)
5. Example Section Teach

Other Helpful Re

6. Section 2 Recording
7. Karel Helper (Visuali
8. Icebreaker Ideas

Important Notes:

- Students should have completed Lectures 1 - 4 and went to last week's sec section recording).
- Let them make mistakes and debug together — this is part of the learning!
- Don't pre-write the solution. Write pseudocode together instead.
- Use `main()` and follow PEP 8 naming conventions. Not sure what this mear
- Save discussions of advanced concepts (i.e. variables or `if __name__ == "_`

Overview of Spread Beepers

The section handout (1) and section solutions (2) are provided under **Key Resour** these one hour after their section starts.
The starter code (3) for you and your students is also under **Key Resources**. This IDE where you and students can type out solutions. It is not a shared link. In othe type, you are editing your own version, and the same applies for the students.
In Section 2, we are going to have Karel take a stack of beepers and spread it out "catch" is that Karel still has infinite beepers in its bag, so a little more effort will terms of logic and loops!

What can I assume students already know?
